```

87

```
TOPOLOGY: unknown
MOLECULE TYPE: peptide
DESCRIPTION: identified as 17.5 kD N-terminal
DESCRIPTION: sequence of Ara h 2 p38 (gene sequence 20..47).
                                       Sequence 58, Application US/09191593
Patent No. 6835824

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                    This polypeptide comprises major peanut allergen Ara hII. Its sequence was deduced from a cDNA clone (AAT76615) isolated from peanut seed cDNA asing a priner (see AAT76617) based on an isolated Ara hi peptide (see AAM24151). The sequence shows significant homology with the conglutin family of seed storage proteins of other legumes. The allergen is recognised by serum 19g from a large proportion of individuals with peanut hypersensitivity. Ara hII and Ara hI (see AAW24149-50) can be used to raise monoclonal antibodies which are used in a specific two-site MAD ELISA for the detection of Ara hI or Ara hII (claimed). IgE- binding Ara hII antigen epitopes (see AAW24189-3) may be used in vaccines to protect against allergic reactions to peanut allergens, e.g. anaphylactic shock. (Updated on 17-OCT-2003 to standardise OS field)

This polypeptide comprises major peanut allergen Ara hII. Its sequence was deduced from cDNA clone P38 (AAT76614), isolated from peanut seed cDNA using a primer (see AAT76617) based on an isolated Ara hI peptide (see AAW24151). The sequence shows significant homology with the conglutin family of seed storage proteins of other legumes. The allergen is recognised by serum IgE from a large proportion of individuals with peanut hypersensitivity. Ara hII and Ara hI (see AAW24149-50) can be used to raise monoclonal antibodies which are used in a specific two-site MAD ELISA for the detection of Ara hI or Ara hII (claimed). IgE- binding Ara hII antigen epitopes (see AAW24189-93) may be used in vaccines to protect against allergic reactions to peanut allergens, e.g. anaphylactic shock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of the Ara h 2 protein from Arachis hypogea. The Ara h 2 protein has 10 IgE (Immunoglobulin E) binding epitopes, three of which are immunodeminant (AAY15272, AAY15272, and AAX15276). By modifying the IgE binding sites the ability of the allergen to provoke an immune response is downregulated. The epitopes of the IgE binding sites can therefore be modified in genetically engineered plants and animals to elicit less of an allergic response. (Updated on 17-OCT-2003 to standardise OS field)

antigenic peptides having a reduced ability to bind immunoglobulin E
(IgB) as compared with the intact (A), or having a sequence substantially
classical to a portion of sequence of an antigen that includes at least
cone IgE binding site, where at least one IgE binding site of the peptide
is altered. The antigenic peptides are used in a composition which is
cusful for reducing risk or severity of allergic reaction to an antigen.
This is done by identifying an individual at risk of allergic reaction to
an antigen by identifying prior display of allergic symptoms when exposed
to the antigen, or a familial relationship with an individual who
companies by identifying prior display of allergic symptoms when exposed
to the antigen, or a familial relationship with an individual who
companies by identifying prior display of allergic symptoms when exposed
to the antigen, or a familial relationship with an individual who
companies an antigen-specific IgE present on one or more mast cells
or basophis in the individual's serum is identified. The individual is
then contacted with a peptide corresponding to a portion of the antigen,
which is selected, formulated, and delivered so that binding of the
composition is also useful for treating and
confined antigen. The composition is also useful for treating and
confined antigen allergic reactions

2003-018765/01. N-PSDB; ABX70606 New modified anaphylactic food allergen, useful for preventing or treating allergic reactions associated with e.g. anaphylactic allergens.

Claim 27; Fig 41; 300pp; English,

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modified so that it cannot participate in the disulphide bond. The modified anaphylactic food allergen, (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (4) a transgenic plant or animal expressing the modified anaphylactic food allergen; (4) a natural anaphylactic food allergen; (5) a ransgenic plant or animal expressing the modified anaphylactic food allergen; (6) a natural anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens. It is also useful for treating wounds in mammals such as bovine, canine, feline, caprine, ovine, porcine, murine or equine species. The present sequence is a peacust allergen (e.g. Ara hl, h2 or h3)

The invention relates to a modified anaphylactic food allergen whose amino acid sequence is substantially identical to that of a natural captural anaphylactic food allergen. The natural anaphylactic food allergen is in its native includes at least one cysteine residue that participates in a disulphide bond when the natural anaphylactic food allergen is in its native conformation, except that the cysteine residue has been modified so that it cannot participate in the disulphide bond. Also included are a method of making a modified anaphylactic food allergen, a nucleotide molecule for causing a site specific mutation in a gene encoding a modified anaphylactic food allergen, a transgenic plant or animal expressing a modified anaphylactic food allergen, a transgenic plant or encoding a natural anaphylactic food allergen by administering a modified above, a mutural anaphylactic food allergen by administering a modified or anaphylactic food allergen and an isolated fragmen of peanut allergen con elgE epitopes recognised when the natural canaphylactic food allergen when the natural canaphylactic food allergen. The invention can be cused for treating allergic anaphylactic food allergen and so contacted with serum igs from individual (s) allergic bean tallergen shra hi, Ara h2, Ara h3 (and their encoding cused for treating allergic reactions or wounds. The present sequence used for treating allergic reactions or wounds. The present sequence contactive anaphylactic food allergen of the invention (or its fragment).

                                                                                                          The present sequence is that of the peanut allergenic protein (AP) encoded by the Ara h2 gene (see AAF90336). The invention relates to a method for producing a peanut plant having reduced, or undetectable, AP content in its seed. A peanut plant call is transformed with a DNA construct containing an antisense AP gene and/or sense AP gene, or their fragments, regenerated to plants, and fertile transgenic plants that produce seeds with reduced AP content are identified. The AP sense or antisense gene may comprise at least a portion of the Ara h2 gene sequence. The seeds are useful for preparation of allergen-free foods. Recombinant AP may be produced and used to produce antibodies useful for detecting AP in foods, and for treatment or prevention of peanut allergy. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing transgenic peanut plants that produce allergen-free seeds, useful in non-allergenic foods, by antisense or sense co-suppression of

The invention provides a tertiary structure for the peanut allergen Ara H 1. The Ara H 1 allergen is found to contain 23 linear IgB-binding epitopes. The invention also provides an isolated recombinant peanut allergen designated Ara h 3 and a nucleotide molecule encoding the peanut allergen Ara h 3. Molecules of the invention are used to protect a host animal from allergic reaction, particularly using a modified allergen which is less reactive with IgB. The invention may also be used to ensure that the allergen is not introduced into genetically modified food. The present sequence represents an Ara h 2 protein fragment. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                              Tertiary structure of peanut allergen Ara h 1 for protection of a host animal from allergic reaction.

New non-naturally occurring protein or polypeptide modified by recombinant DNA techniques, useful for treating multiple sclerosis, diabetes mellitus, myasthenia gravis, scleroderma, allergic rhinitis, colitis, cancer or psoriasis.

Example 2; Page 18; 90pp; English

The invention relates to a non-naturally occurring protein or polypeptide

(I) modified by recombinant DNA techniques comprising: a C-terminal

clement comprising an II-Fey motif; and an interventing element comprising

clement comprising an II-Fey motif; and an interventing element comprising

clement comprising an II-Fey motif; and an interventing element comprising

a sequence of 4-11 amino acid residues where the modification by

CC described are methods for: suppressing or immune response

directed toward an MHC (major histocompatibility complex) Class II
presented epitope of interest. Suppressing an immune response directed

toward an MHC Class II-presented epitope of interest comprises: providing

a nucleic acid sequence encoding the MHC Class II-presented epitope of

interest, the nucleic acid sequence encoding an II-Key motif located 4-11

amino acids upstream from the N-terminal residue of the MHC Class II
crescented epitope of interest, and modifying the II-Key motif. Enhancing an

immune response directed toward an MHC Class II-presented epitope of

interest comprises: providing a nucleic acid sequence encoding the MHC

Class II-presented epitope of interest, the nucleic acid sequence lacking

cresidue of the MHC Class II-presented epitope. The protein or

cresidue of the MHC Class II-presented epitope. The protein or

cresidue of the MHC Class II-presented epitope. The protein or

cresidue of interest corresponds to a protein or polypeptide (I) modified by recombinant DNA techniques is useful for

creating, wirus, parasle, fingues rickettaia or other infectious

creating, wirus, parasle, fingues rickettaia or other infectious

creating infectious diseases caused or associated with infectious

creating an experience or treating themselved agents or other infections and acused or associated or other infections partogen and acused or associated sclerosis, lupus erythematosus, diabetes mellitus, myasthenia gravis, autoimmune thyroiditis, scleroderma, dermatomyositis, pemphigus, ast psoriasis or | sequence of adenomas. The present sequence represents the amino acid sequence openut allergen Ara h 2 MHC class II-presented epitope used in the invention. allergic rhinitis, topical dermatitis, colitis, cancer,

The invention relates to a modified anaphylactic food allergen has an anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modified so that it cannot participate in the disulphide bond. The modification may also comprise mutation of the IgE binding sites to reduce allergenicity. Also included are: (1) a method of making a conficied anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (4) a method of treating an individual by callergen; (5) at ransgenic plant or animal expressing the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; and an isolated fragment of peanut allergen Ara h 1. The modified anaphylactic food allergen is useful for preventing or treating allergic cod allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens. It is also useful for treating wounds in mammals such as bovine, canine, feline, caprine, ovine, porcine, mutated to alter its IgE binding characteristics. Note: The present sequence is not shown in the specification but was created by the indexer using information provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121

The invention relates to a novel antigen presentation enhancing hybrid polypeptide. The novel polypeptide has an N-terminal element consisting of 4-16 residues of a mammalian Ii-Key peptide and its non-N-terminal deletion modifications, a chemical structure covalently linking the N-terminal element to an MHC class II presented epitope of a C-terminal element. The C-terminal element comprises an antigenic epitope, which binds to an antigenic peptide binding site of an MHC class II molecule. The antigen presentation enhancing hybrid polypeptide has the following activities: antibacterial, virucide, fungicide, antirheumatic, antiarthritic, neuroprotective, dermatological, immunosuppressive, antiarthritic, neuroprotective, dermatological, immunosuppressive cantiarthritic, neuroprotective, dermatological, immunosuppressive antistrathritic, nouroprotective, dermatological, immunosuppressive cantiarthritic, neuroprotective, dermatological, immunosuppressive cantiarthritic, and antithyroid. The antigen presentation enhancing hybrid polypeptide is useful for modulating the immune response in an individual and for treating infections (such as bacteria, virus, parasite and fungus), rheumatoid arthritis, multiple sclerosis, lupus erythematosus, diabetes mellitus, mysathenia gravis, autoimmune thyroiditis, scleroderma, dermatomyositis and pemphigus. This sequence represents a mammalian Ii key related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel II-Key/antigen presentation enhancing hybrid polypeptide, useful for treating infections, rheumatoid arthritis, multiple sclerosis, lupus erythematosus and diabetes mellitus.
                                                                                                                                                                                                                                                                                 antigen presentation enhancing hybrid polypeptide; mammalian Ii-Key;

Peanut Ara h2 mut. (W22A/E35A/P41A/D53A/D60A/D67A/R120A/L130A/L147A) Allergy; Ara h1; Ara h2; Ara h3; IgE binding site; peanut; mutant; ABU52577 standard; protein; 157 AA (first entry) 10-MAR-2003 ABU52577; RESULT 13 EXEXEXEXE.

The invention relates to a modified anaphylactic food allergen has an anamino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modification may also comprise mutation of the IgE binding sites to reduce allergenicity. Also included are: (1) a method of making or for causing a site specific mutation in the modified anaphylactic food allergen; (2) a nucleotide molecule encoding allergen; (3) a transgenic plant or animal expressing the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; and an isolated fragment of peanut allergen Ara h. The modified anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, rubber or preferably anaphylactic allergens. It is also useful for treating wounds in mammals such as bovine, canine, feline, caprine, owine, porcine, murine or equine species. The present sequence is a food allergen, mutated to alter its IgE binding characteristics. Note: The present sequence is not shown in the specification but was created by the indexer using information provided in the specification Sosin H, Sampson H, Bannon GA, Burks WA, Cockrell G; I, Connaughton C, Helm RM, King NE, Kopper RA, Maleki SJ; Shin DS, Stanley JS; New modified anaphylactic food allergen, useful for preventing or treating allergic reactions associated with e.g. anaphylactic allergens. mutein; anaphylactic food allergen; antiallergenic; vaccine; Example 13; Page; 300pp; English 18-MAR-2002; 2002WO-US009108. 16-MAR-2001; 2001US-0276822P. 18-MAR-2002; 2002US-00276822.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a tertiary structure for the peanut allergen Ara H 1. The Ara H 1 allergen is found to contain 23 linear IgE-binding epitopes. The invention also provides an isolated recombinant peanut allergen designated Ara h 3 and a nucleotide molecule encoding the peanut allergen Ara h 3. Molecules of the invention are used to protect a host animal from allergic reaction, particularly using a modified allergen which is less reactive with IgE. The invention may also be used to ensure that the allergen is not introduced into genetically modified food. The present sequence represents a recombinant Ara h 2 protein. (Updated on 17-OCT-2003 to standardise OS field)

treating allergic reactions associated with e.g. anaphylactic allergens.
```

Example 13; Fig 51; 300pp; English

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural camphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modification may also comprise mutation of the IgE binding sites to creduce allergenicity. Also included are: (1) a method of making a comportic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (3) a transgenic plant or animal expressing the modified canaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen; (5) and an isolated fragment of peanut allergen Ara h1. The modified canaphylactic food allergen is useful for preventing or treating allergen; cubber or preferably anaphylactic allergens. It is also useful for reactions associated with any natural allergens ut is slow useful for treating wounds in mammals such as bovine, canne, feline, caprine, covine, porcine, murine or equine species. The present sequence is a constant allergen, Ara h2, with an N-terminal T7 tag and a C-terminal His

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
